OBSERVABILITY WITH AN AI SRE BUILT IN

Know what happened. Prove it. Fix it.

Every issue comes with the exact request behind it, and everything around it: the response, the trace, what the customer saw. An AI reads it and opens the fix.

You hear it from customers first

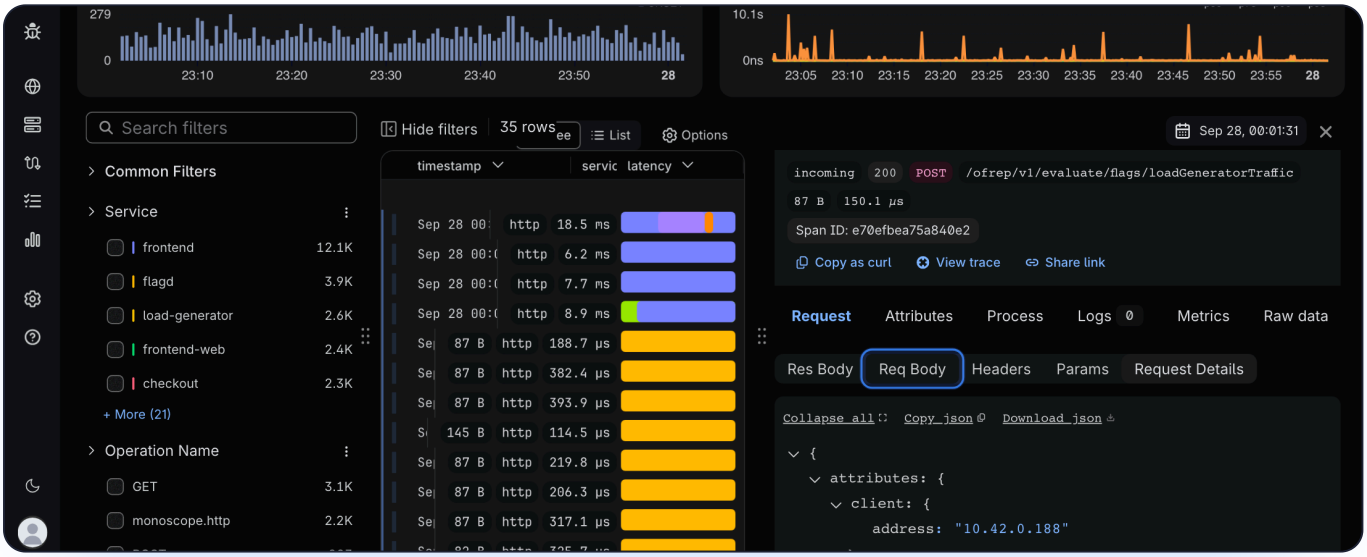

A payment fails and the first alert is a support ticket. By the time engineering looks, the logs are partial and the request is gone.

The trace was sampled. The body was never stored.

Most APM tools sample traces and drop request bodies to control cost. So you reproduce the bug instead of reading it.

A supplier broke it, and you can't prove it

The partner API returned `200 OK` and never did the work. Without the request and the response, it's your word against theirs.

The exact request behind an issue: headers, request body, response, trace and logs, as they were.

KNOW

Every error, with the exact request behind it

- Errors and slow endpoints grouped into issues, each with the full request and response
- Breaking changes in your APIs and your suppliers' APIs, flagged with the request that showed them
- Session replay linked to the failing request

PROVE

Never sampled. The record, not a summary of it.

- Every request, response, log and span is kept
- What you sent, what the supplier answered and when, to the millisecond
- Share any request with a link instead of describing it

FIX

An AI that reads the actual request

- Routines investigate on a schedule and post the root cause in Slack
- Opens a pull request with the fix, with the evidence attached
- Reviews risky changes against production data before they merge

HOW IT WORKS

Live in an afternoon, on the instrumentation you have

1 **Send your telemetry**

Add the SDK, or point your existing OpenTelemetry exporter at monoscope. 780+ integrations, no proprietary agent.

2 **Issues arrive with evidence**

Errors, regressions and breaking API changes, each with the request, response, trace and logs.

3 **AI investigates and acts**

It finds the root cause, tells you in Slack and opens the pull request. You review it with the request in front of you.

What teams see after switching

5,000+ developers use monoscope

20x	70%	9x	5x	3x	500ms
faster mean time to resolution	less manual troubleshooting	fewer customer support calls	faster incident debugging	faster system recovery	cut from improved endpoints
Blockradar	SAMEDAY CUSTOM	Platnova	CORONA MANAGEMENT SYSTEMS	partna	PayFonte

> "We had a major incident, and our tech support could see via [monoscope] which third-party integration partner was responsible, and could take action without needing the engineering team's help."
>
> **Joshua Chinemezum** · CEO, Platnova

> "The best observability tool we use today at Woodcore, monoscope notifies us about any slight change that happens on the system."
>
> **Samuel Joseph** · CEO, Woodcore

PRICING

Pay per event, not per host

One price for requests, logs and spans. No host fees, no add-ons, and no sampling to make the bill fit.

A SMALL TEAM, PER MONTH	ESTIMATED BILL	MONTHLY	YEARLY
Datadog		$453	$5,439
Splunk Observability		$349	$4,184
Sentry (no metrics)		$189	$2,269
monoscope Cloud		**$69**	**$824**

Workload: 50M events a month (requests, logs and spans), 5 hosts, 2,000 metric series, 5,000 replay sessions, 30-day retention on every vendor. Public list prices, September 2026. Full assumptions on page 3.

See it on your own traffic

Free up to 10,000 events a day, with no credit card. Or talk it through with an engineer and we'll set it up with you.

FOR YOUR SECURITY AND PROCUREMENT REVIEW

Where your data lives, and who controls it

	CLOUD	CLOUD + YOUR OWN S3	SELF-HOSTED
Data stored in	monoscope-managed storage	Your S3-compatible bucket, as open Delta Lake and Parquet tables	Your servers
Retention	30 days	Unlimited, at no extra cost	Your choice
Price	Free up to 10k events/day, then $29/month for 20M events and $1 per extra million	From $199/month for 100M events, then $1 per extra million	Community Edition free (AGPL-3.0). Enterprise from $500/month

Security and privacy

GDPR — We sign a data processing agreement (DPA) on request.

EU data region — Host your data in the EU.

SSO — Single sign-on and advanced auth on Enterprise.

Redaction — Strip headers and body fields such as `$.password` by JSONPath in the SDK, before data leaves your app.

Data ownership — On the own-S3 plan, the database is your bucket. Query it with DuckDB, Spark or SQL.

Open source — The full platform is AGPL-3.0 on GitHub, so your team can audit the code that handles your data.

Switching without a cutover

1. Point a copy of your OpenTelemetry exporter at monoscope, or add the SDK to one service.
2. Run it next to your current tool for one to two weeks and compare what each one caught.
3. Move the rest of your services and retire what you no longer need.

Startup program

Eligible startups get up to $10,000 of monoscope covered in their first year.

Volume pricing

Custom pricing above about 1 billion events a month. Email hello@monoscope.tech.

How the cost estimate on page 2 was calculated

Estimates from public list prices, September 2026, annual billing where offered, 30-day retention on every vendor, 2 kB average event, one metric datapoint per series per minute. Datadog: Infrastructure $15 and APM $31 per host; logs $0.10 per GB ingested plus $2.50 per million indexed; custom metrics $5 per 100 series beyond 100 per host; RUM $0.15 plus Session Replay $2.50 per 1,000 sessions. Splunk: Observability Cloud App & Infrastructure $60 per host; Splunk Cloud log ingest at about $12.50 per GB/day per month; RUM $14 per 10,000 sessions; custom metrics not modelled. Sentry: Team $26; spans $1.60 per million beyond 5M; errors at $0.29 per 1,000 assuming 0.5% of events are errors; replays $3.75 per 1,000; no metrics product. monoscope Cloud: $29 includes 20M events, 20M metric datapoints and 2,000 replay sessions; then $1 per million events, $1 per 10 million metric datapoints and $1 per 1,000 sessions. Everything else is included. Workload priced: 50M events a month, 5 hosts, 2,000 metric series, 5,000 replay sessions. Run your own numbers at monoscope.tech/#pricing.
